

Managed Services

Our Managed Services Team help organizations achieve Vulnerability Management Success.

Outpost24 offers a full-service alternative to internal management of vulnerability assessments, reducing the cost and time needed to hire, train and manage an in-house IT security team. Regardless of business size, Outpost24's Managed Services will seamlessly integrate the vulnerability management solution that meets the needs of your organization.

Solutions:

Basic Solution

This offer is best suited for small to medium sized organizations looking to get basic parameters for a vulnerability management program in place. With 12 years of VM experience, our team will ensure best practice

set-up and configuration of the Outpost24 tools. Outpost24 team will maintain the program and notify customers of high risk vulnerabilities.

Customized Solution

For organizations with a complex network set up, Widespread geographic distribution, or unique organizational goals, we are able to offer a fully customizable solution tailored specifically to our customers' needs.

Advanced Solution

This offer combines best practices set-up, configuration and implementation of Outpost24 technology, with expert analysis of scan results on a monthly or quarterly basis. The Advanced MS offering is perfect for an organization looking for a firm understanding and analysis of their scanning results, in relation to their organizational goals and objectives.

PCI 11.2

For organizations looking for the fastest, most reliable way to achieve PCI compliance, our PCI 11.2 Managed Services are a great for organizations looking to meet these requirements quickly and ensure quality.

Why Managed Services?

Managed Services allow you to quickly and easily adopt a vulnerability management program with constant support of vulnerability management experts, so that you can focus on your core business.

Our team of highly experienced technical experts will partner with your organization throughout the initial implementation, scanning and reporting, to help remediation activities.

As your organization establishes processes and adopts best practices, we maintain ultimate flexibility and allow you to oversee your vulnerability management program internally.

Professional Services

Maintaining an in-depth understanding of organizational security levels can be time consuming and complex. The penetration testing services offered by Outpost24 provide organizations with a clear understanding of their current security level and offer advice on how to further improve defenses.

Outpost24's highly skilled team has years of experience in penetration testing as well as expertise in vulnerability management, incident response and information security strategies. Outpost24's penetration testers hold certifications in the following relevant fields: CISSP, ISSAP, OPSA, CTA, OPST, OPSE and OWSE. We have performed penetration tests for organizations in industries ranging from governmental and insurance, to retail and finance.

Our services:

Network & Infrastructure Assessments, Web Application & Mobile Application Testing

Scopes for Penetration Testing

Outpost24 offers penetration testing on networks, web applications and mobile applications. Our security consultants will work closely with organizations to choose which testing option best suits their requirements.

Network & Infrastructure Assessments:

We offer network infrastructure tests on internal, external and wireless networks. These are manual tests performed by our team using a variety of network penetration techniques and tools.

Web Application Assessments:

We offer web application testing ranging from highly automated to in-depth manual penetration testing. Security testers will test for technical flaws (e.g. SQL Injection, XSS) and business logic flaws (e.g. negative quantity in a webshop order).

Mobile Application Assessments:

Many companies are including mobile applications as part of their product portfolio or as a marketing medium. We have seen that many fundamental security design flaws/mistakes from web applications are re-introduced in the mobile application landscape. Outpost24's security testers can analyze mobile applications for classic flaws and mobile-specific security issues. We are trained and experienced in testing applications running on both IOS and Android.

Phishing

Outpost24 offers organizations the possibility to simulate e-mail based phishing attacks in order to assess and increase the IT security awareness level of its employees. The selection of possible scenarios varies from average phishing attacks to more personalized spearphishing attacks. Each phishing campaign is customizable to fit the needs of your organization. Whether it is a small-scale generic e-mail campaign or a more advanced spearphishing scenario, Outpost24 has the tools and expertise to launch, analyse and report the results of a phishing attack simulation on your organization's employees.

Classic versus Scenario-Based Testing

Classic penetration testing consists of well-organized, methodical testing with each possible point of attack examined, evaluated and documented. In a classic penetration test we aim to identify all weak points in a given area.

Our security consultants work with organizations to establish a scope for the testing to define which systems should be tested and to what extent—in order to meet budget and security needs.

Scenario-based testing is more agile than the classical model. It focuses on threats and risks using creative testing and established strategies. Full coverage of all potential risks is not the main goal of this test model.

The ideal scenario-based test starts with our security consultants discussing different scenarios with the goal of finding vulnerabilities or risks unique to an organization's network /system. This type of testing is best suited for organizations that are looking for answers on specific threats within their networks and systems.
