Outpost24

Tech evolves at a high-octane pace. Ensure your app security keeps up.

Stay ahead of threats with pinpoint insights about application vulnerabilities.

Creating applications can improve customer experience, streamline operational processes, or even transform business models. It may even be one of your corporate strategies. But each application has security implications. And not keeping your app security up to speed with your changes increases the risk of cybercriminals disrupting your business.

To help you stay a step ahead, Outpost24 has developed the industry's most complete process to identify application weaknesses and correlate with infrastructure vulnerabilities. It begins with our expertise as ethical hackers and application Penetration testing service (Pen test). We've put that knowledge into an automated tool—Appsec Scale—that accelerates your understanding of risk, and we top it off with Secure Web Application Tactics (SWAT & SNAPSHOT), a hybrid automated tool plus Pen testing service that enables you to keep business critical applications free from disruption. So when you're racing against hackers to your vulnerabilities, we'll give you a head start.

More than 3 out of 5 survey respondents reduced security flaws by 50% or more with Outpost24's Appsec solutions.

When to improve your application security solution:

Business would be impaired by disruption to web applications resulting in loss of revenue or inability to serve customers

Unsure about risk levels of internally developed or commercial web applications and web interfaces

Applications are developed with an agile process and are constantly changing, but the DevOps process does not include a complete security analysis

Human-based Pen testing is expensive, so testing is infrequent with large gaps of time between tests

Application security testing is uncoordinated with other vulnerability assessments leaving uncertainty about true security posture

Continuous testing with minimal impact on business and bottom line.

Outpost24 Appsec web application insights.

There are two business drivers in application security testing: cost and time. One-time penetration (Pen) testing gives you a thorough view of vulnerabilities. But if you make a change to the app or the infrastructure on which it runs, you'll need to test again to ensure you didn't introduce new vulnerabilities. Regular Pen testing gets expensive fast. Alternatively, automated testing—such as Appsec Scale—gives you a good balance of speed to business-results for the volume of applications that keep your business moving ahead.

Our hybrid solution, SWAT, combines our automated testing with human Pen testing by Outpost24 security experts for business-critical apps. For agile DevOps processes, this testing can be conducted for every app change faster than—and just as deep as—Pen testing. You can adjust a combination of Pen testing, bulk testing and hybrid testing to meet the complete needs of your application security strategy. And because we evaluate both the application and the infrastructure on which it runs, Outpost24 can present a more complete view of risk.

Always on
without turning you off

Test continuously and accurately to maximize your coverage with minimal impacts to your DevOps or production applications

Think like
a hacker

By combining application security testing with infrastructure vulnerability management, Outpost24 helps you see how a bad actor would pivot and move to an alternate attack vector for a more complete view of your security risk

Works as fast
as you do

SWAT and Appsec Scale continually update as you make changes to your apps and infrastructure—or Pen tests your remediation efforts at time intervals that suit your business

Digs down deep
when needed

Go as deep as needed for application logic tests for issues such as confidentiality, access restrictions and logical errors

Gives it to you
straight

Automate accurate report distribution to key stakeholders to improve security awareness, and focus your remediation efforts with zero false positives in business critical applications

Here for you
when you need us

24/7, interact directly with a human, technical support expert who can help your organization learn and understand risk in spite of limitations in security resources or technical expertise

Expert testing support within tool		✔	✔

In-depth look at our solutions

SWAP/SNAPSHOT hybrid testing—dashboard

Focus on trends that impact risk

Highlight the findings of your most recent changes

Appsec Scale—application enrollment
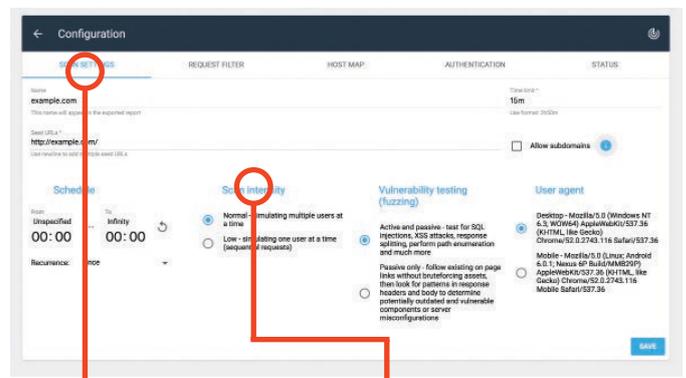

Simple onboarding process reduces time spent for volume application testing

Stay in control of testing traffic for each application

SWAP/SNAPSHOT hybrid testing—test results

Detailed recreation flow helps you understand remediation

Discuss findings and issues with the experts right in the tool

Appsec Scale—test results

Risk score indexing helps you focus on the biggest impact

Detailed insights show how test was run to simplify remediation
